

ODC Mini-App Game Hackathon - Jordan

Mini PRD — Jordan Cultural Map: JordaVie

1) Product summary

Product name (working): JordaVie: *The name is Jordan + “Vie” (life in French)*

Format: Mobile-first mini-app game (one experience with a hub + 2 mini-games)

Core idea: An interactive map of Jordan that lets players choose a governorate and play a culturally inspired mini-game. MVP launches with:

- **Ajloun:** Tree nurturing game (المولدة / oak-related iconic tree concept)
- **Madaba:** Mosaic sliding puzzle (الفسيفساء)

2) Why we're building this

Hackathon goal

Deliver a **playable, stable, demo-ready mini-app** that showcases Jordan's culture through fun gameplay.

User value

- A lightweight game you can enjoy in under 1–3 minutes.
- Learn a small cultural fact each session.
- Feel progression and replay motivation (streak / completion / “collect”).

Business/eco value (aligned with your concept)

- **Daily re-engagement loop** (8-hour watering)
- **Organic growth loop** via invite links (reward-based sharing)
- Soft brand touchpoint with “MaxIt” jar mechanic (can be mocked if no real integration).

3) Success criteria (MVP)

Must be true in the demo:

- Smooth mobile UX, no crashing, clear start → play → end loop for both games.
- Map hub works and routes correctly to Ajloun and Madaba.
- Tree game progression works (stages + counter toward 21).
- Puzzle game win state works (solved detection) + move limit is enforced.
- Rewards UI exists (invite CTA + reward effect) even if integration is simulated.

Nice-to-have:

- Basic onboarding/rules screens
- Sound / micro-animations
- End-of-game feedback screen and replay/back-to-map buttons

4) Scope

In-scope (MVP)

A) Map Hub

- Jordan map (stylized) with clickable governorates.
- Only **Ajloun** and **Madaba** were included in MVP.
- Each enabled governorate shows a small image + 1-line cultural teaser.

B) Ajloun Mini-game — Tree Nurturing

- Progress states: seed → plant → small tree → big tree (mapped across 21 waterings).
- Watering is available **every 8 hours** (timer).
- Each watering shows **1 Jordan fact** (content from a facts list).
- Streak indicator + “MaxIt special jar” mechanic:
 - If the user completed all 3 waterings from the previous day, “MaxIt jar” becomes clickable to refill once (MVP can implement a simplified rule set).

C) Madaba Mini-game — Mosaic Sliding Puzzle

- Sliding puzzle with mosaic image.
- Move limit (e.g., 40 moves for 3×3, 80 for 4×4 — choose one for MVP).
- Win detection triggers a success screen.
- “Invite for extra moves” reward (e.g., +5 moves).

D) Invite & Rewards (MVP-friendly)

- A share button generates a **mock invite link/share sheet**.
- Reward simulation options:
 1. "I invited a friend" button for demo mode (adds reward)
 2. Local "referral code" input (simple)
(Pick the easiest for hackathon speed.)

Out of scope (MVP)

- Complex backend, accounts, and real-time multiplayer
- Real MaxIt API integration (unless provided officially)
- Full Jordan governorates coverage (future phase)

5) Target users & use cases

Primary users

- ODC / Orange audience at the hackathon demo
- Mobile-first casual users who like quick games and cultural content

Key use cases

1. "I have 1 minute" → open → map → quick puzzle → done
2. "Daily check-in" → open → Ajloun → water → learn a fact → close
3. "I want rewards" → share invite → get extra jar/moves → replay

6) User journey (MVP)

1. **Launch**
2. **Map Hub** (Ajloun / Madaba enabled)
3. Select governorate:
 - Ajloun → Tree screen (timer + water button)
 - Madaba → Puzzle screen (moves + board)
4. End state:
 - Tree: confirmation + fact + progress bar toward 21
 - Puzzle: success/fail + replay + back to map
5. Optional: invite CTA for extra benefits

7) Core mechanics (rules)

Ajloun tree rules (MVP version)

- The player has watering availability every **8 hours**.
- Each watering increments **WaterCount** (0 → 21).
- Tree stage UI updates at milestones (e.g., 1, 7, 14, 21).
- Show a random (or sequential) fact per watering.
- Streak:
 - Track daily completion: up to 3 waterings/day.
 - If “yesterday completed = 3”, unlock “MaxIt jar refill” once.

Madaba puzzle rules (MVP version)

- Grid size: pick **3×3** for speed and stability.
- Moves limit: set a reasonable number (e.g., 40).
- Win detection: board equals solved state.
- Extra moves reward via invite simulation (+5).

8) Content requirements

- **21 Jordan facts** (short, 1–2 lines) for the tree loop.
- 1–3 mosaic images (optimized for mobile).
- Ajloun tree visuals (seed/plant/tree stages).
- Map visuals (Jordan outline + highlights for Ajloun/Madaba).

9) UX/UI requirements

- Mobile-first layout (one-hand friendly)
- Clear visual hierarchy:
 - Primary CTA: Play / Water / Move
 - Secondary: Invite / Back to map
- Accessibility basics:
 - Large tap targets
 - High contrast for text on images
 - Avoid tiny fonts

10) Technical approach (MVP)

- **No heavy backend**
- Store progress locally (LocalStorage / device storage):
 - lastWaterTime, waterCount, dailyCount, streak, maxItJarState
 - puzzle state / attempts / best score (optional)
- Invite simulation handled locally (demo-safe).

11) Risks & mitigations

- **Timer bugs / time zones** → use epoch timestamps + simple countdown UI
- **Puzzle solvability issues** → generate puzzle states by shuffling from solved state only
- **Too much scope** → lock MVP to 2 governorates + 1 puzzle size + minimal art

12) Milestones (hackathon-friendly)

- **Day 1:** Map hub + routing + basic UI
- **Day 2:** Tree game mechanics + local storage + facts
- **Day 3:** Puzzle game + win detection + move limits
- **Day 4:** Invite simulation + polish + demo video + packaging

13) Acceptance checklist (MVP “done”)

- Map → Ajloun opens Tree game
- Map → Madaba opens Puzzle game
- Tree watering increments to 21 and persists after refresh
- 8-hour lock works and displays time remaining
- Each watering shows a fact
- Puzzle move limit works and win screen appears
- Invite simulation adds jar/moves correctly
- End-to-end demo works on mobile screen sizes
